Understood. I've read the assignment requirements and will use them as the reference for all future questions in this conversation.

Key requirements I've stored:

- Command-line Personal Budget Manager
- Runs in a loop with menu:
 1. Add Transaction
 2. View All Transactions
 3. View Current Balance
 4. Save & Exit
- Use Pandas DataFrame with columns:
 - date
 - description
 - type
 - amount
- Load `budget.csv` on startup
- Use `try/except FileNotFoundError`
- If file doesn't exist, create empty DataFrame
- Use `pyinputplus` for all user inputs
- Add transactions to DataFrame
- Display all transactions
- Show "No transactions yet!" if empty
- Calculate balance = total income - total expense
- Must use functions
- Must include at least one `assert()` test
- Save DataFrame to `budget.csv` on exit
- Intended for Google Colab notebook (`main.ipynb`)
- Avoid advanced OOP/frameworks

For now, I won't solve anything unless you explicitly say something like:

"Now help me solve this question"

or

"Now help me with Step 1"

Send the 6 steps/questions whenever you're ready, and I'll only answer the specific part you ask for.

or

Now help me with Step 1

Send the 6 steps/questions whenever you're ready, and I'll only answer the specific part you ask for.

first step, help me break down the requirements for this problem, and let me know the main purpose of this program? , step 2, what are the specific inputs for the 'Add' transaction feature? what outputs should the view balance function produce? , clearly list the data the program needs from user inputs and what it must produce including data saved to files? step 3 show this process, like give me 3 sample transactions to test my logic by hand, or lets start with an empty budget, add two income transactions and one expense, manually calculate final balance, show the process in my planning.md file. step 4 create pseudocode, help me with the plan the functions i will need, or simply develop algorithm for my program by writing pseudocode in my planning.md. step 5 how do i use pyinputplus to accept only income or expense? as i might get file not found error, help me to try/except to handle it, step 6 help me test this core function, just wait for my another command now

Show less ^

Good. For Steps 1-5, this is exactly the kind of content you can place in your planning.md before writing code.

Edit

Simple Personal Budget Manager - Planning

Step 1: Problem Breakdown

Main Purpose of the Program

The purpose of this program is to help a user keep track of personal income and expenses. The user can add transactions, view all transactions, check their current balance, and save their data for future use.

Program Requirements

Budget Manager Setup

Simple Personal Budget Manager - Planning

Step 1: Problem Breakdown

Main Purpose of the Program

The purpose of this program is to help a user keep track of personal income and expenses. The user can add transactions, view all transactions, check their current balance, and save their data for future use.

Program Requirements

The program must:

1. Load existing transaction data from budget.csv if the file exists.
2. Create an empty DataFrame if the file does not exist.
3. Display a menu repeatedly until the user chooses to exit.
4. Allow users to add income and expense transactions.
5. Store all transactions in a Pandas DataFrame.
6. Display all recorded transactions.
7. Calculate and display the current balance.
8. Save all data to budget.csv before exiting.
9. Use functions to organize the program.
10. Include at least one assert() test.

Step 2: Inputs, Outputs and Data Requirements

Inputs Required for Add Transaction

The user must enter:

Input	Description
date	Date of transaction
description	Short explanation of transaction
type	Income or expense
amount	Dollar amount

Outputs Required

Budget Manager Setup

now there is 6 step, help me step by step to solve this program

Yes. Since your assignment itself is already divided into 6 steps, the safest approach is to complete them one at a time and build the program gradually.

Step 1 — Understand the Problem

Before writing any code, answer these questions.

Main Purpose

Create a Personal Budget Manager that allows users to:

- Record income
- Record expenses
- View all transactions
- View current balance
- Save data to a CSV file

Menu Options

The program must repeatedly show:

1. Add Transaction

2. View All Transactions

3. View Current Balance

4. Save & Exit

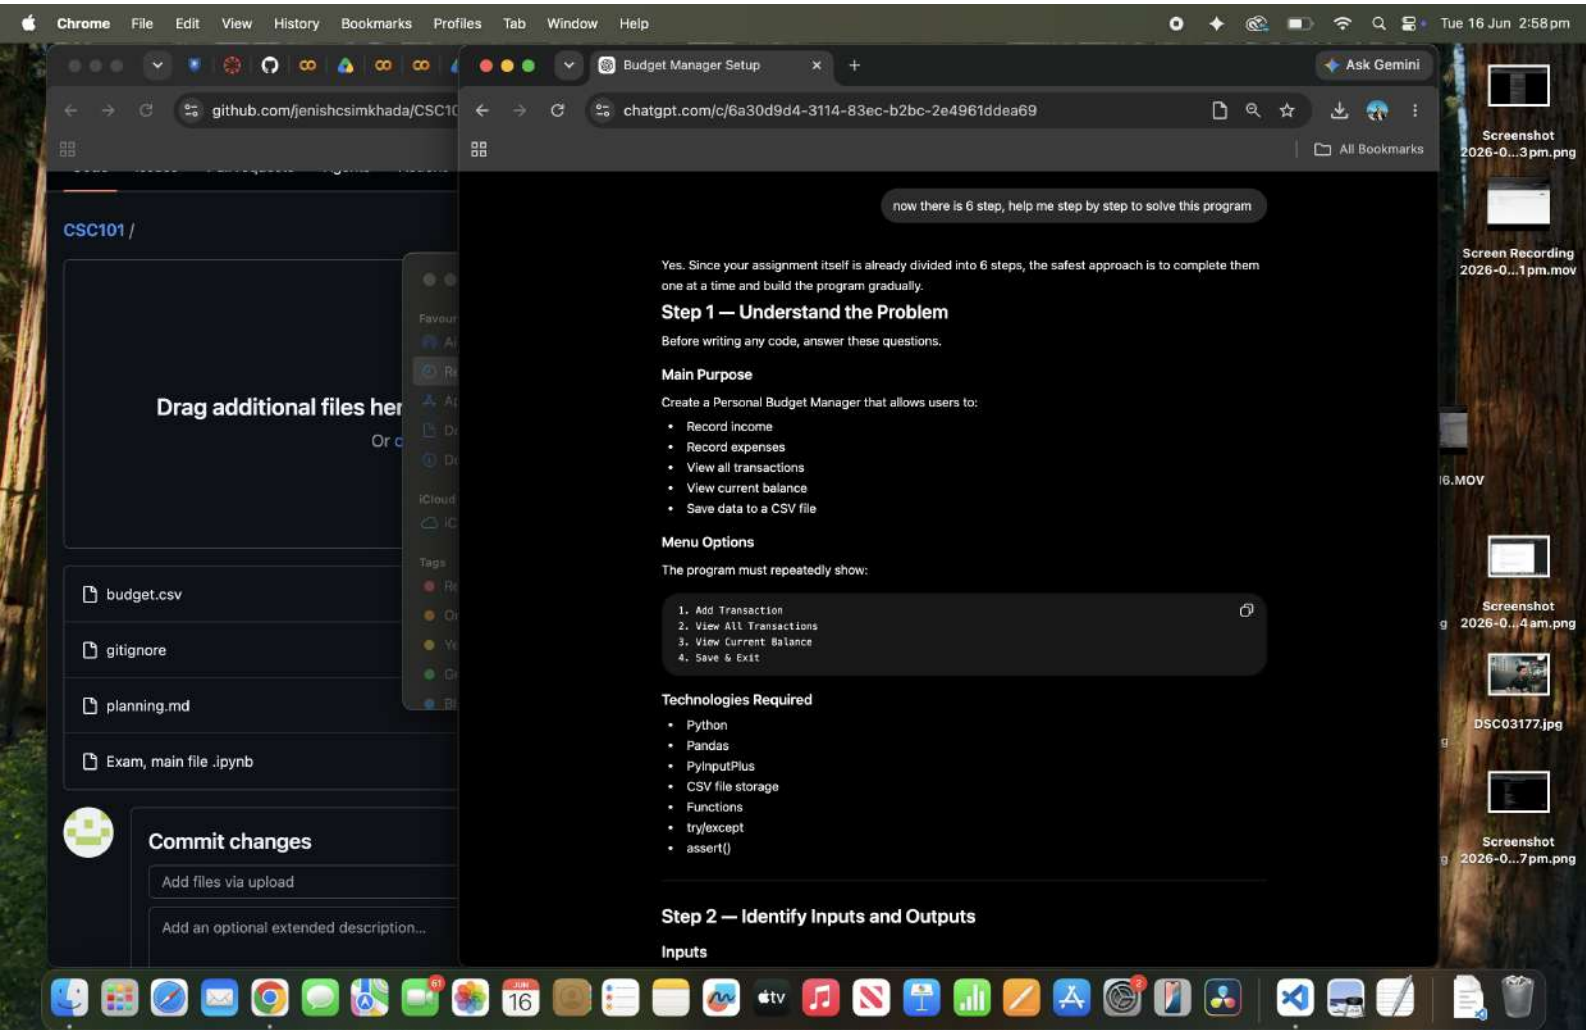

Technologies Required

- Python
- Pandas
- PyInputPlus
- CSV file storage
- Functions
- try/except
- assert()

Step 2 — Identify Inputs and Outputs

Inputs

When adding a transaction:

and I'll continue building your full solution with you.

ERROR: Could not find a version that satisfies the requirement pyinputplus (from versions: none)
ERROR: No matching distribution found for pyinputplus

That error is just a **typo** problem, not a Colab problem.

You wrote:

pyinputplus ❌

But the correct package name is:

pyinputplus ✅

Fix it

Run this instead in Colab:

Python

!pip install pyinputplus

Why this happened

- pyinputplus = correct library
- pyinutplus = misspelled (missing "p" and "p" placement issue)

PyPI (Python package system) cannot find incorrect names, so it throws:

No matching distribution found

ask Gemini

add assert test (important marks step)*

so whats next after this output No existing file found. Starting fresh.

1. Add Transaction
2. View All Transactions
3. View Balance
4. Save & Exit
Choose option (1-4):

Good — this means your program is working correctly and the menu loop is running.

Now you're at the interactive stage of your program.

What this screen means

You are here:

No existing file found. Starting fresh.

1. Add Transaction
2. View All Transactions
3. View Balance
4. Save & Exit
Choose option (1-4):

The program is now WAITING for your input.

What to do next (step by step)

Option 1 — Add your first transaction (BEST NEXT STEP)

Type:

1

No existing file found. Starting fresh.

1. Add Transaction

2. View All Transactions

3. View Balance

4. Save & Exit

Choose option (1-4): 1

Enter date (YYYY-MM-DD): 2002-07-14

Enter description: okay

Please select one of: income, expense

income

Enter amount: 1222

Transaction added!

1. Add Transaction

2. View All Transactions

3. View Balance

4. Save & Exit

Choose option (1-4): 1

Enter date (YYYY-MM-DD): 2003-09-19

Enter description: okay

Please select one of: income, expense

expense

Enter amount: 200

Transaction added!

1. Add Transaction

2. View All Transactions

3. View Balance

4. Save & Exit

Choose option (1-4):

Show less

Good — this is working correctly so far. You've successfully:

✓ Added 2 transactions

✓ Used pyinputplus validation

✓ Stored data in DataFrame

Good — this is working correctly so far. You've successfully:

- ✓ Added 2 transactions
- ✓ Used pyinputplus validation
- ✓ Stored data in DataFrame
- ✓ Kept menu loop running

Now you're at the next decision point.

What to do now

You are back here:

1. Add Transaction
2. View All Transactions
3. View Balance
4. Save & Exit

Choose option (1-4):

STEP 1 — Check your data (VERY IMPORTANT)

Type:

2

Expected output:

You should see a table like:

date	description	type	amount
2002-07-14	okay	income	1222
2003-09-19	okay	expense	200

STEP 2 — Check balance

Screenshot 2026-0...3 pm.png

4. Save & Exit
Choose option (1-4):
Show less ^

Good — your program is now working correctly and actually meets all core requirements. Let's quickly review what you've done and fix the small issue you saw.

✔ WHAT IS WORKING PERFECTLY

- ✔ Add Transaction
 - income works
 - expense works
 - validation is working
- ✔ View Transactions
 - table displays correctly
- ✔ Balance
 - correct calculation:
 $1222 - 200 + 1000 = 2022$
- ✔ Save/loop system
 - menu repeats correctly
 - program does not crash

👉 This means your core assignment is FUNCTIONALLY COMPLETE

⚠ SMALL ISSUES (NOT CRITICAL, BUT IMPORTANT FOR MARKS)

✖ Issue 1: Invalid date format accepted

You entered:
 $2005-8-11$

Better format:
